

Getz Clinical On-Premise

What is Getz Clinical On-Premise Solution?

Getz Clinical On-Premise Solution is a platform that allows the installation and running of Getz Clinical Connect (GCC) in the hospital's local or internal server.

Getz Clinical offers an On-Premise solution to address hospital-specific data security needs. With this, security stays in-house ensuring compliance with hospital's data privacy and information security requirements. It gives customers more levels of control over their own data.

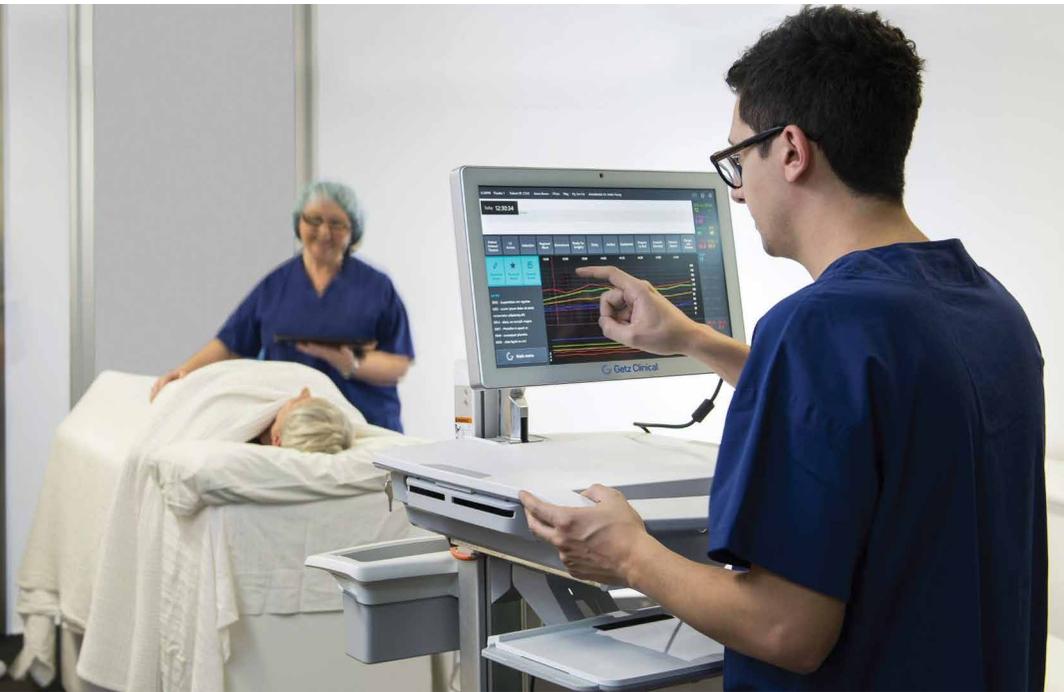

Increased Security Compliance

Patient medical record is one of the major assets of a hospital. They are treated with high-level of confidentiality and strict regulatory protocols are observed when processing them. Getz Clinical On-Premise is designed to provide flexible solution to address these needs while maintaining the integrity and reliability of your data.

Flexible and reliable solutions
for every hospital

Adherence to Data Privacy and Information Security

Both international and local legislations have placed regulatory policies to ensure the protection of data privacy and information security. To comply with these requirements, hospitals must set up multi-level security to minimise risks and prevent data breaches.

On-Premise solution provides this additional layer of security as the data storage is kept in-house. Only authorized staff are allowed to have access, preventing the risk of data losses.

More Control Over Server Hardware

Having an On-Premise solution means having your own infrastructure at the hospital premises or on-site. Hence, it gives customers more control over server hardware. Hospitals can easily upgrade or even make customisations on their server's hardware based on their hospital's storage needs.
